Introduction

· Project background and context

Space X advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because Space X can reuse the first stage. Therefore, if we can determine if the first stage will land, we can determine the cost of a launch. This information can be used if an alternate company wants to bid against space X for a rocket launch. This goal of the project is to create a machine learning pipeline to predict if the first stage will land successfully.

Problems you want to find answers

- What factors determine if the rocket will land successfully?
- The interaction amongst various features that determine the success rate of a successful landing.
- What operating conditions needs to be in place to ensure a successful landing program.

Methodology

Executive Summary

- Data collection methodology:
 - Data was collected using SpaceX API and web scraping from Wikipedia.
- Perform data wrangling
 - · One-hot encoding was applied to categorical features
- · Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
 - · How to build, tune, evaluate classification models

Data Collection

- The data was collected using various methods
 - Data collection was done using get request to the SpaceX API.
 - Next, we decoded the response content as a Json using .json() function call and turn it into a pandas dataframe using .json_normalize().
 - We then cleaned the data, checked for missing values and fill in missing values where necessary.
 - In addition, we performed web scraping from Wikipedia for Falcon 9 launch records with BeautifulSoup.
 - The objective was to extract the launch records as HTML table, parse the table and convert it to a pandas dataframe for future analysis.

Data Collection - SpaceX API

- We used the get request to the SpaceX API to collect data, clean the requested data and did some basic data wrangling and formatting.
 - The link to the notebook is https://github.com/pshanky27/IBM-Datascience-Spacex-Capstone/blob/main/O1_SpaceX_Data_Collection_API.ipynb

```
1. Get request for rocket launch data using API

In [6]: spacex_url="https://api.spacexdata.com/v4/launches/past"

In [7]: response = requests.get(spacex_url)

2. Use json_normalize method to convert json result to dataframe

In [12]: # Use json_normalize method to convert the json result into a dataframe

# decode response content as json
static_json_df = res.json()

In [13]: # apply json_normalize
data = pd.json_normalize(static_json_df)

3. We then performed data cleaning and filling in the missing values

In [30]: rows = data_falcon9['PayloadMass'].values.tolist()[0]
df_rows = pd.DataFrame(rows)
df_rows = df_rows.replace(np.nan, PayloadMass)
data_falcon9['PayloadMass'][0] = df_rows.values
data_falcon9
```

Data Collection - Scraping

- We applied web scrapping to webscrap Falcon 9 launch records with BeautifulSoup
- We parsed the table and converted it into a pandas dataframe.
- The link to the notebook is https://github.com/pshanky27/ IBM-Datascience-Spacex-Capstone/blob/main/ O2_SpaceX_Web_Scraping.ipynb

```
1. Apply HTTP Get method to request the Falcon B rocket launch page

1. [4] static_url = "https://en.wideedia.org/w/inex.shpftitic_list_of_falcon_b_md_falcon_Heavy_launchesboldid=180768052"

In [5]:

In [5]:

If use requests.get() method with the provided static_url.

If assign the response to a object the model of the provided static_url.

In [6]:

200

2. Create a GrounfulSour_object from the HTML response

2n [6]:

If the Securify(Soup() to create a BeautifulSour_object from a response text content sour_beautifulSour_object from a response text content sour_beautifulSour_object from a response text content sour_beautifulSour_object was created properly

2n [7]:

Print the page title to verify if the BeautifulSour_object was created properly

2n [7]:

In [7]:

If use sour_title attribute sour_title attribute sour_title

2n Extract all column names from the HTML table header

1n [20]:

Column_names = []

4 Apply find_st() function with 'th' element on finat_launch_table

4 Threate each if a element and apply the provided extract_column_from_beader() to get a column_name alement to non-many column many co
```

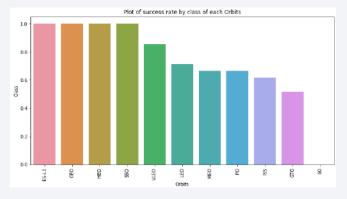

Data Wrangling

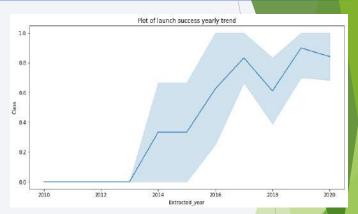

- We performed exploratory data analysis and determined the training labels.
- We calculated the number of launches at each site, and the number and occurrence of each orbits
- We created landing outcome label from outcome column and exported the results to csv.
- The link to the notebook is https://github.com/pshanky27/IBM-Datascience-Spacex-Capstone/blob/main/03_SpaceX_Data_Wrangling.ipynb

EDA with Data Visualization

► We explored the data by visualizing the relationship between flight number and launch Site, payload and launch site, success rate of each orbit type, flight number and orbit type, the launch success yearly trend.

 The link to the notebook is https:// github.com/pshanky27/IBM-Datascience-Spacex-Capstone/blob/ main/05_SpaceX_EDA_Data_Visualizat ion.ipynb

EDA with SQL

- We loaded the SpaceX dataset into a PostgreSQL database without leaving the jupyter notebook.
- We applied EDA with SQL to get insight from the data. We wrote queries to find out for instance:
 - The names of unique launch sites in the space mission.
 - The total payload mass carried by boosters launched by NASA (CRS)
 - The average payload mass carried by booster version F9 v1.1
 - The total number of successful and failure mission outcomes
 - The failed landing outcomes in drone ship, their booster version and launch site names.

The link to the notebook is https://github.com/pshanky27/IBM-Datascience-Spacex-Capstone/blob/main/04_SpaceX_EDA_SQL.ipynb

Build an Interactive Map with Folium

- We marked all launch sites, and added map objects such as markers, circles, lines to mark the success or failure of launches for each site on the folium map.
- We assigned the feature launch outcomes (failure or success) to class 0 and 1.i.e., 0 for failure, and 1 for success.
- ▶ Using the color-labeled marker clusters, we identified which launch sites have relatively high success rate.
- We calculated the distances between a launch site to its proximities. We answered some question for instance:
 - Are launch sites near railways, highways and coastlines.
 - Do launch sites keep certain distance away from cities.

Build a Dashboard with Plotly Dash

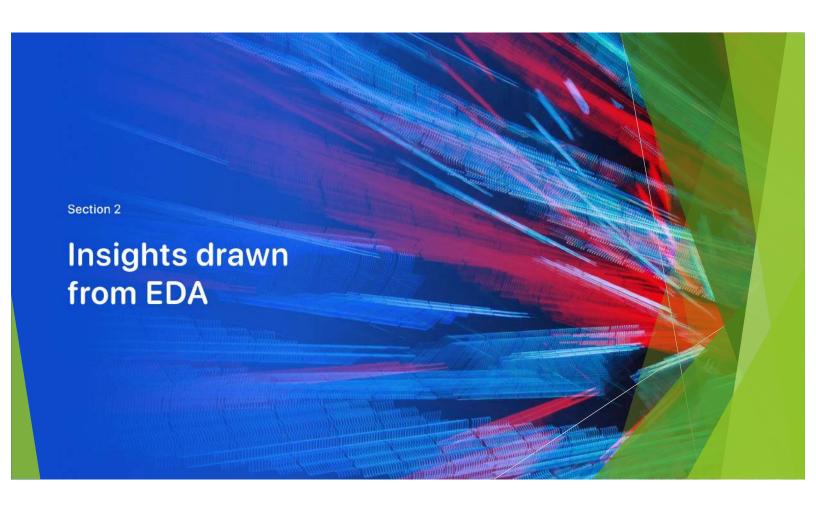

- We built an interactive dashboard with Plotly dash
- ▶ We plotted pie charts showing the total launches by a certain sites
- ▶ We plotted scatter graph showing the relationship with Outcome and Payload Mass (Kg) for the different booster version.
- The link to the notebook is https://github.com/pshanky27/IBM-Datascience-Spacex-Capstone/blob/main/ 07_SpaceX_Interactive_Visual_Analytics_Plotly.py

Predictive Analysis (Classification)

- ▶ We loaded the data using numpy and pandas, transformed the data, split our data into training and testing.
- ▶ We built different machine learning models and tune different hyperparameters using GridSearchCV.
- ▶ We used accuracy as the metric for our model, improved the model using feature engineering and algorithm tuning.
- We found the best performing classification model.

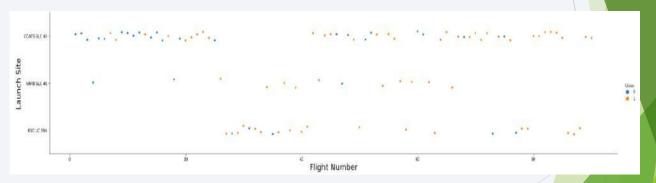

Results

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

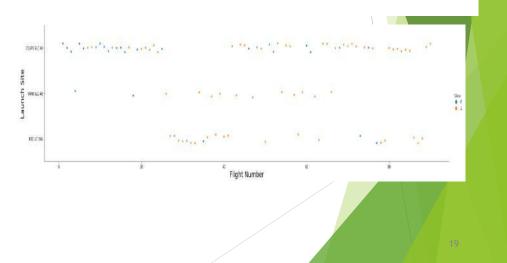

Flight Number vs. Launch Site

From the plot, we found that the larger the flight amount at a launch site, the greater the success rate at a launch site.

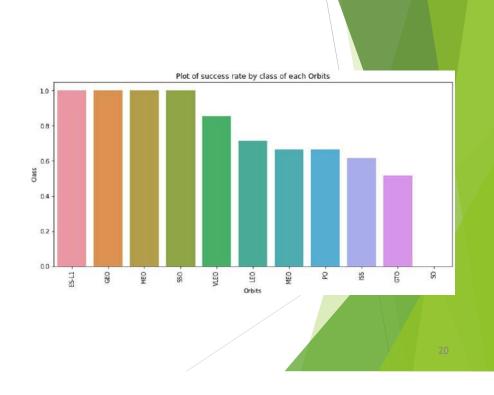

Payload vs. Launch Site

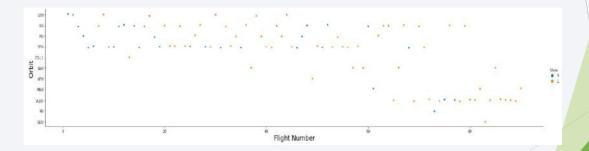

Success Rate vs. Orbit Type

► From the plot, we can see that ES-L1, GEO, HEO, SSO, VLEO had the most success rate.

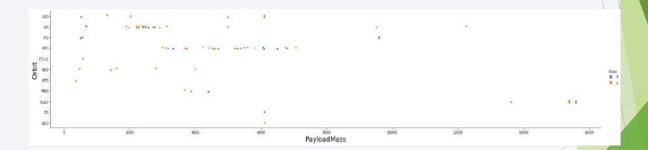

Flight Number vs. Orbit Type

► The plot below shows the Flight Number vs. Orbit type. We observe that in the LEO orbit, success is related to the number of flights whereas in the GTO orbit, there is no relationship between flight number and the orbit.

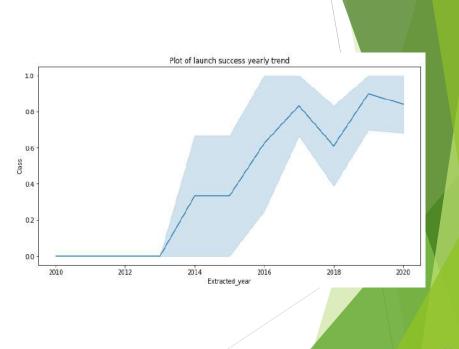

Payload vs. Orbit Type

We can observe that with heavy payloads, the successful landing are more for PO, LEO and ISS orbits.

Launch Success Yearly Trend

► From the plot, we can observe that success rate since 2013 kept on increasing till 2020.

All Launch Site Names

We used the key word DISTINCT to show only unique launch sites from the SpaceX data.

Display the names of the unique launch sites in the space mission

Out[10]:		launchsite
	0	KSC LC-39A
	1	CCAFS LC-40
	2	CCAFS SLC-40
	3	VAFB SLC-4E

Launch Site Names Begin with 'CCA'

	Dist	olay 5 reco	rds where	launch sites be	gin with the	tring 'CCA'					
n [11]:		FROM WHEN LIM.	ECT * M SpaceX RE Launc IT 5	hSite LIKE 'CC sk_2, database							
ut[11]:		date	time	boosterversion	launchsite	payload	payloadmasskg	orbit	customer	missionoutcome	landingoutcome
	0	2010-04- 06	18:45:00	F9 v1.0 B0003	CCAFS LC- 40	Dragon Spacecraft Qualification Unit	O	LEO	SpaceX	Success	
	1		18:45:00 15:43:00	F9 v1.0 B0003		Dragon Spacecraft Qualification Unit Dragon demo flight C1, two CubeSats, barrel of	0	LEO (ISS)	SpaceX NASA (COTS) NRO	Success	Failure (parachute) Failure (parachute)
	1 2	06			40 CCAFS LC-	Dragon demo flight C1, two CubeSats, barrel		LEO	NASA (COTS)		(parachute)
	1	06 2010-08- 12	15:43:00	F9 v1 0 B0004	CCAFS LC- 40 CCAFS LC-	Dragon demo flight C1, two CubeSats, barrel of	0	LEO (ISS)	NASA (COTS) NRO	Success	(parachute) Failure (parachute)

We used the query above to display 5 records where launch sites begin with `CCA`

Total Payload Mass

We calculated the total payload carried by boosters from NASA as 45596 using the query below

```
Display the total payload mass carried by boosters launched by NASA (CRS)

In [12]:

task_3 = '''

SELECT SUM(PayloadMassKG) AS Total_PayloadMass
FROM SpaceX
WHERE Customer LIKE 'NASA (CRS)'

'''

create_pandas_df(task_3, database=conn)

Out[12]:

total_payloadmass

0 45596
```

Average Payload Mass by F9 v1.1

We calculated the average payload mass carried by booster version F9 v1.1 as 2928.4

```
Display average payload mass carried by booster version F9 v1.1

In [13]:

task_4 = '''

SELECT AVG(PayloadMassKG) AS Avg_PayloadMass
FROM SpaceX
WHERE BoosterVersion = 'F9 v1.1'

""

create_pandas_df(task_4, database=conn)

Out[13]:

avg_payloadmass
0 2928.4
```

First Successful Ground Landing Date

We observed that the dates of the first successful landing outcome on ground pad was 22nd December 2015

Successful Drone Ship Landing with Payload between 4000 and 6000

Out[15]: boosterversion

0 F9 FT B1022

1 F9 FT B1026

2 F9 FT B1021.2

3 F9 FT B1031.2

We used the WHERE clause to filter for boosters which have successfully landed on drone ship and applied the AND condition to determine successful landing with payload mass greater than 4000 but less than 6000

Total Number of Successful and Failure Mission Outcomes

List the total number of successful and failure mission outcomes

```
In [16]:

task_7a = '''

SELECT COUNT(MissionOutcome) AS SuccessOutcome
FROM SpaceX
WHERE MissionOutcome LIKE 'Success''

'''

task_7b = '''

SELECT COUNT(MissionOutcome) AS FailureOutcome
FROM SpaceX
WHERE MissionOutcome LIKE 'Failure''

'''

print('The total number of successful mission outcome is:')
display(create_pandas_df(task_7a, database=conn))
print()
print('The total number of failed mission outcome is:')
create_pandas_df(task_7b, database=conn)

The total number of successful mission outcome is:
successoutcome

0 100

The total number of failed mission outcome is:
failureoutcome

0 100
```

 We used wildcard like '%' to filter for WHERE MissionOutcome was a success or a failure.

Boosters Carried Maximum Payload

We determined the booster that have carried the maximum payload using a subquery in the WHERE clause and the MAX() function.

```
List the names of the booster_versions which have carried the maximum payload mass. Use a subquery
In [17]: task_8 = ***
SELECT BoosterVersion, PayloadMasskG
                   SELECT BOOSES. ...
FROM SpaceX
WHERE PayloadMossKG - (
SELECT MAX(PayloadMossKG)
                                              FROM SpaceX
                    ORDER BY BoosterVersion
           create_pandas_df(task_0, database=conn)
Out[17]:
              boosterversion payloadmasskg
           1 F9 B5 B1048.5
                                     15600
                F9 B5 B1049.4
           3 F9 B5 B1049.5
                                      15600
           4 F9 B5 B1049.7
              F9 B5 B1051,3
                                      15500
           6 F9 B5 B1051.4
                                      15600
              F9 B5 B1051.6
              F9 B5 B1056.4
                                      15600
                F9 85 B1058.3
                                      15600
                F9 B5 B1060.2
          11 F9 B5 B1060.3
```

2015 Launch Records

We used a combinations of the WHERE clause, LIKE, AND, and BETWEEN conditions to filter for failed landing outcomes in drone ship, their booster versions, and launch site names for year 2015

```
List the failed landing_outcomes in drone ship, their booster versions, and launch site names for in year 2015

In [18]:

task_9 = '''

SELECT BoosterVersion, LaunchSite, LandingOutcome
FROM SpaceX
WHERE LandingOutcome LIKE 'Failure (drone ship)'
AND Date BETWEEN '2015-01-01' AND '2015-12-31'

create_pandas_df(task_9, database=conn)

Out[18]:

boosterversion launchsite landingoutcome

0 F9 v1.1 B1012 CCAFS LC-40 Failure (drone ship)

1 F9 v1.1 B1015 CCAFS LC-40 Failure (drone ship)
```

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad))

```
In [19]:
    task_10 = '''
    SELECT LandingOutcome, COUNT(LandingOutcome)
    FROM SpaceX
    WHERE DATE BETWEEN '2010-06-04' AND '2017-03-20'
    GROUP BY LandingOutcome
    ORDER BY COUNT(LandingOutcome) DESC
    ...
    create_pandas_df(task_10, database=conn)
```

Out[19]:

	landingoutcome	count
0	No attempt	10
1	Success (drone ship)	6
2	Failure (drone ship)	5
3	Success (ground pad)	5
4	Controlled (ocean)	3
5	Uncontrolled (ocean)	2
6	Precluded (drone ship)	1
7	Failure (parachute)	1

- We selected Landing outcomes and the COUNT of landing outcomes from the data and used the WHERE clause to filter for landing outcomes BETWEEN 2010-06-04 to 2010-03-20.
- We applied the GROUP BY clause to group the landing outcomes and the ORDER BY clause to order the grouped landing outcome in descending order.

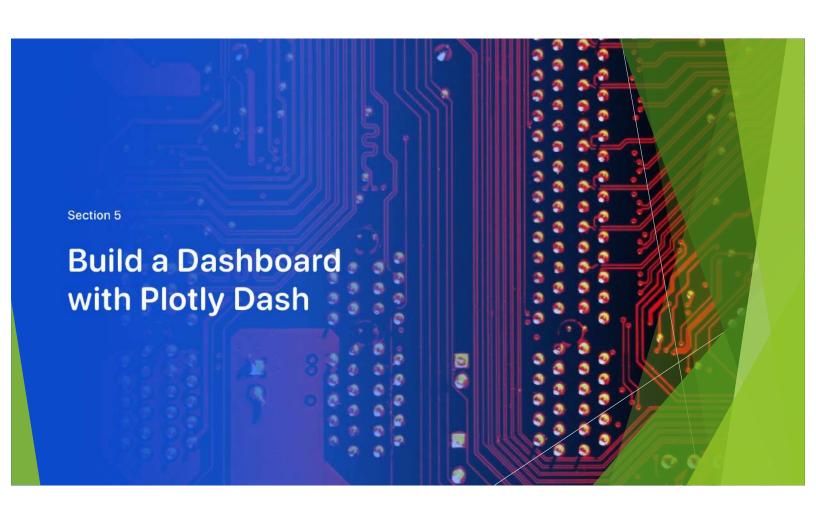

We can see that the SpaceX launch sites are in the United States of America coasts.
Florida and California

Markers showing launch sites with color labels

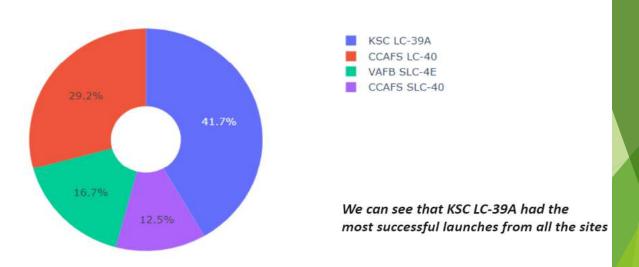

Launch Site distance to landmarks

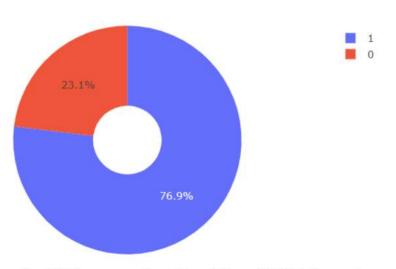

Pie chart showing the success percentage achieved by each launch site

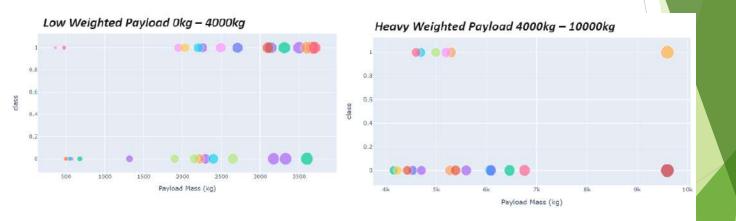

Pie chart showing the Launch site with the highest launch success ratio

KSC LC-39A achieved a 76.9% success rate while getting a 23.1% failure rate

Scatter plot of Payload vs Launch Outcome for all sites, with different payload selected in the range slider

We can see the success rates for low weighted payloads is higher than the heavy weighted payloads

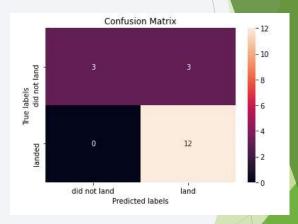

Classification Accuracy

The decision tree classifier is the model with the highest classification accuracy

Confusion Matrix

The confusion matrix for the decision tree classifier shows that the classifier can distinguish between the different classes. The major problem is the false positives .i.e., unsuccessful landing marked as successful landing by the classifier.

Conclusions

We can conclude that:

- ► The larger the flight amount at a launch site, the greater the success rate at a launch site.
- ▶ Launch success rate started to increase in 2013 till 2020.
- ▶ Orbits ES-L1, GEO, HEO, SSO, VLEO had the most success rate.
- ▶ KSC LC-39A had the most successful launches of any sites.
- The Decision tree classifier is the best machine learning algorithm for this task.
